# NYSCEF eFiling Automation System

Product Overview

BCL Technologies' NYSCEF eFiling Automation is a solution that allows law firms to convert legal documents from PDF to PDF/A for filing without human intervention. By eliminating human intervention and automating your workflow, our software guarantees your filings will be seamless and error-free, and therefore allows you to free up resources for other tasks.
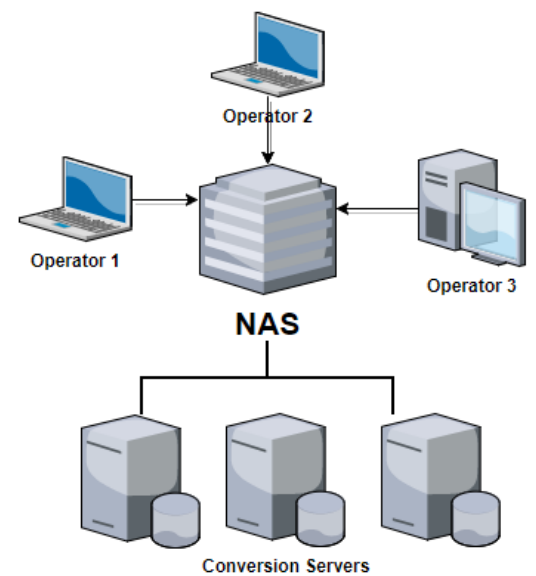

How it works

The software will constantly monitor the operators' input folder for PDF documents. Once processed, the ready-to-be-filed PDF/A will be saved in the output folder. The administrator can set the folder locations, the maximum output size, and image resolution. All conversion activities will be logged and if there is an error, the PDF will be moved to the error folder.

Key Features

- Centralized input and output folders
- PDF/A-1b compliant
- Page rastering (12-1200 dpi)
- OCR to make the text searchable
- Error logging

Client-Server Architecture

Our software is built on top of a scalable network architecture with a central Network-Attached Storage (NAS). From the operator's point-of-view, there is only client software, and nothing else. Remote Conversion Servers perform the actual PDF conversion. Everything revolves around the central NAS, which is just a simple file server—it could be an actual computer, or a dedicated NAS or RAID array. When a Conversion Server is not busy, it will pick up the next job available from the NAS, and the output is then copied back to the NAS. Meanwhile, the client software keeps monitoring the NAS for progress.
